Notes:
Required slab joints and pouring sequence construction joints shall align with open joints at the front face of the parapets.

Pours must be made in order as numbered. Pours with the same number may be placed simultaneously or separately. 48 hours shall elapse between the end of a pour and the start of the next pour. 72 hours shall elapse between the end of a pour and the start of the adjacent pour. 72 hours shall elapse between the end of a deck pour and the start of a parapet railing pour. Any railing pours made before the entire slab unit has been placed must be approved by the Engineer.

Concrete in bridge superstructure shall be consolidated for the entire pour before any concrete has taken its initial set. This may require the use of a retarding agent.

The Contractor must obtain approval from the Engineer for any deviations from the pouring sequence shown.

ANCHOR BOLT DETAIL
(No Scale)

NOTE:
Anchor bolts may be cast in place or drilled and grouted into place. If Anchor Bolts are to be cast in place, the Galvanized Sheet Metal Sleeves will not be required. If Anchor bolts are to be drilled and grouted in place, the Galvanized Sheet Metal Sleeves shall be cast in place as shown. Sleeves shall be dry packed with Styrofoam, urethane foam or approved equal prior to pouring of concrete. After pouring of the cap and prior to erection of Structural Steel, the dry pack shall be removed and holes for the anchor bolts shall be accurately drilled into the masonry. Bolts placed in drilled holes shall be accurately set fixed using a QPL approved epoxy or non-shrink grout that completely fills the holes. Galvanized Sheet Metal Sleeves will not be paid for directly but will be considered subsidiary to the item "Structural Steel in Plate Girder Spans, (M 270, Gr. 50)".

GENERAL NOTES:
Elastomeric bearings shall conform to Section 808 of the Standard Specifications and shall be paid for at the unit price bid for "Elastomeric Bearings."

External load plates and shear blocks shall conform to AASHTO M 270, Grade 50. Pipe sleeves shall be ASTM A500, Grade B, and shall be galvanized to conform to AASHTO M 232, Class C or ASTM B695, class 50.

External load plates with shear blocks shall be completely fabricated (including bevel and bolt holes) and shall be cleaned before vulcanizing to the elastomeric bearing. The surface in contact with the elastomeric bearing shall be cleaned in accordance with Section 808.03. Other surfaces shall be blast cleaned in accordance with subsection 807.84(b) for painted steel.

External load plates and shear blocks shall be painted in accordance with Section 807.75. The color of the paint shall be brown and shall match Fed. Std. 595B, Color Chip No. 20108. Mask areas that are to be welded in the field.

Anchor Bolts and Nuts shall conform to subsection 807.07 of the Standard Specifications. Steel Washers shall conform to AASHTO M 270, Grade 50. The anchor bolt grade of steel shall be as specified in the "Table of Fabricator Variables". Indentations shall be circular with rounded bottoms and staggered as shown in the details.

Pipe Sleeves, Anchor Bolts, Washers, and Nuts shall be paid for at the unit price bid for "Structural Steel in Plate Girder Spans, (M 270, Gr. 50)". (M 270, Gr. 50)". External load plates and blocks will not be measured or paid for separately, but will be considered incidental to the unit price bid for "Elastomeric Bearings". Bearings shall be seated in accordance with subsection 808.08. This work and materials are considered subsidary to the item "Elastomeric Bearings" and will not be paid for directly.

Unless otherwise approved by the Engineer, welding of the external load plate at expansion bearings to the girder will be allowed only when 1) the approximate average air temperature during the 24 hour period immediately preceeding welding is between 40°F and 80°F; and 2) the slots in the external load plate are positioned to center on the anchor bolts; and 3) no horizontal deformation of the elastomeric pad is evident. If welding at other temperatures is required, the engineer will provide adjustment data.

① Care shall be taken to ensure that the external load plate is in full and complete contact with the beam or girder flange before welding begins.

② Thus the C.L. of Bearings shall coincide with the C.L. of Girders.

Note:
The direction of bevel of the external load plate may not be accurately depicted with respect to the "T(a)" and "T(b)" values shown in the "Table of Fabricator Variables."

① For fabrication of the Steel Washers when the tabulated O.D. exceeds ASTM F436, the I.D. of the washers shall conform to ASTM F436 and the thickness of 3/8" shall be used.

NOTE:
Anchor bolts may be cast in place or drilled and grouted into place. If Anchor Bolts are to be cast in place, the Galvanized Sheet Metal Sleeves will not be required. If Anchor bolts are to be drilled and grouted in place, the Galvanized Sheet Metal Sleeves shall be cast in place as shown. Sleeves shall be dry packed with Styrofoam, urethane foam or approved equal prior to pouring of concrete. After pouring of the cap and prior to erection of Structural Steel, the dry pack shall be removed and holes for the anchor bolts shall be accurately drilled into the masonry. Bolts placed in drilled holes shall be accurately set fixed using a OPL approved epoxy or non-shrink grout that completely fills the holes. Galvanized Sheet Metal Sleeves will not be paid for directly but will be considered subsidiary to the item "Structural Steel in Plate Girder Spans, (M 270, Gr. 50)".

GENERAL NOTES:
Elastomeric bearings shall conform to Section 808 of the Standard Specifications and shall be paid for at the unit price bid for "Elastomeric Bearings."

External load plates and shear blocks shall conform to AASHTO M 270, Grade 50. Pipe sleeves shall be ASTM A500, Grade B, and shall be galvanized to conform to AASHTO M 232, Class C or ASTM B695, class 50.

External load plates with shear blocks shall be completely fabricated (including bevel and bolt holes) and shall be cleaned before vulcanizing to the elastomeric bearing. The surface in contact with the elastomeric bearing shall be cleaned in accordance with Section 808.03. Other surfaces shall be blast cleaned in accordance with subsection 807.84(b) for painted steel.

External load plates and shear blocks shall be painted in accordance with Section 807.75. The color of the paint shall be brown and shall match Fed. Std. 595B, Color Chip No. 20108. Mask areas that are to be welded in the field.

Anchor Bolts and Nuts shall conform to subsection 807.07 of the Standard Specifications. Steel Washers shall conform to AASHTO M 270, Grade 50. The anchor bolt grade of steel shall be as specified in the "Table of Fabricator Variables". Indentations shall be circular with rounded bottoms and staggered as shown in the details.

Pipe Sleeves, Anchor Bolts, Washers, and Nuts shall be paid for at the unit price bid for "Structural Steel in Plate Girder Spans, (M 270, Gr. 50)", (M 270, Gr. 50)". External load plates and blocks will not be measured or paid for separately, but will be considered incidental to the unit price bid for "Elastomeric Bearings". Bearings shall be seated in accordance with subsection 808.08. This work and materials are considered subsidary to the item "Elastomeric Bearings" and will not be paid for directly.

Unless otherwise approved by the Engineer, welding of the external load plate at expansion bearings to the girder will be allowed only when 1) the approximate average air temperature during the 24 hour period immediately preceeding welding is between 40°F and 80°F; and 2) the slots in the external load plate are positioned to center on the anchor bolts; and 3) no horizontal deformation of the elastomeric pad is evident. If welding at other temperatures is required, the engineer will provide adjustment data.

GENERAL NOTES

For Project Bridge General Notes Sheet, see Dwg. No. 59691 . General notes specific to this bridge follow.

SEISMIC ZONE: 1 SDI = 0.133g. Site Class = C

STEEL PILING:
Pile casings are required for all piles within MSE. Casings shall be installed prior to or during the embankment construction and shall extend from top of leveling pad to bottom of cap. Pile casing material shall be of sufficient strength to retain its original form, free from harmful distortions after compaction of the fill material surrounding it. The minimum inside diameter of the casing shall be 22". Piles shall be driven through the open casings. After driving is complete, the pile casings shall be filled with Class S Concrete, an approved non-shrink grout, mixture used for Portland Cement Concrete Pavement, or other approved material in a single continuous operation to completely fill voids. Pile casings and concrete will not be paid for directly but shall be considered subsidiary to the item "Steel Piling (HP 12x53)" & "Steel Piling (HP 14x89)".

TEXTURED COATING FINISH: Class 3 Textured Coating Finish shall be applied to bridge surfaces as specified in Special Provision Job No. CA0601 "Textured Coating Finish" and in accordance with Subsection 802.19(b)(3). Textured Coating Finish shall not be applied on surfaces where Class 1 Protective Surface Treatment is applied.

PAINT: All structural steel except galvanized members and some surfaces in contact with concrete, and as otherwise noted, shall be cleaned in accordance with Section 807.84(b) and painted as specified in Subsection 807.75. Color of paint shall be DARK BROWN and shall match Fed. Std. 595B, Color Chip No. 20108.

EXISTING BRIDGE: Existing Bridge Nos. A3092 (I-30 EB log #3.64) and B3092 (I-30 WB log #3.65) are 258' long consisting of three composite W-Beam simple spans supported by substructures consisting of R.C. int. Bents with multi-columns on spread footings and Pile End Bents. The existing bridges are located in approximately the same location as the proposed bridge. Plans can be obtained upon request from the Construction Contract Procurement Section of the Program Management Division.

REMOVAL AND SALVAGE: The new bridges are to be built in stages and existing Bridge Nos. A&B3092 shall be removed in accordance with Section 205. Stage removal of Bridge No. A3092 will be required for Stage 1 & 3 Construction. Stage removal of Bridge No. B3092 will be required for Stage 2 Construction. All material from the existing bridge shall become the property of the Contractor.

(1) Care shall be taken to ensure that the external load plate is in full and complete contact with the girder flange before welding begins.

(2) Thus the C.L. of Bearings shall coincide with the C.L. of Girders.

(3) For fabrication of the Steel Washers when the tabulated O.D. exceeds ASTM F436, the I.D. of the washers shall conform to ASTM F436 and the thickness of 3/8" shall be used.

Note:
The direction of bevel of the external load plate may not be accurately depicted with respect to the "Ta" and "Tb" values shown in the "Table of Fabricator Variables."

NOTE:
Anchor bolts may be cast in place or drilled and grouted into place. If Anchor Bolts are to be cast in place, the Galvanized Sheet Metal Sleeves will not be required. If Anchor bolts are to be drilled and grouted in place, the Galvanized Sheet Metal Sleeves shall be cast in place as shown. Sleeves shall be dry packed with Styrofoam, urethane foam or approved equal prior to pouring of concrete. After pouring of the cap and prior to erection of Structural Steel, the dry pack shall be removed and holes for the anchor bolts shall be accurately drilled into the masonry. Bolts placed in drilled holes shall be accurately set fixed using a DPL approved epoxy or non-shrink grout that completely fills the holes. Galvanized Sheet Metal Sleeves will not be paid for directly but will be considered subsidiary to the item "Structural Steel in Plate Girder Spans, (M 270, Gr. 50)".

GENERAL NOTES:
Elastomeric bearings shall conform to Section 808 of the Standard Specifications and shall be paid for at the unit price bid for "Elastomeric Bearings."

External load plates and shear blocks shall conform to AASHTO M 270, Grade 50. Pipe sleeves shall be ASTM A500, Grade B, and shall be galvanized to conform to AASHTO M 232, Class C or ASTM B695, class 50.

External load plates with shear blocks shall be completely fabricated (including bevel and bolt holes) and shall be cleaned before vulcanizing to the elastomeric bearing. The surface in contact with the elastomeric bearing shall be cleaned in accordance with Section 808.03. Other surfaces shall be blast cleaned in accordance with subsection 807.84(b) for painted steel.

External load plates and shear blocks shall be painted in accordance with Section 807.75. The color of the paint shall be brown and shall match Fed. Std. 595B, Color Chip No. 20108. Mask areas that are to be welded in the field.

Anchor Bolts and Nuts shall conform to subsection 807.07 of the Standard Specifications. Steel Washers shall conform to AASHTO M 270, Grade 50. The anchor bolt grade of steel shall be as specified in the "Table of Fabricator Variables". Indentations shall be circular with rounded bottoms and staggered as shown in the details.

Pipe Sleeves, Anchor Bolts, Washers, and Nuts shall be paid for at the unit price bid for "Structural Steel in Plate Girder Spans, (M 270, Gr. 50)". External load plates and blocks will not be measured or paid for separately, but will be considered incidental to the unit price bid for "Elastomeric Bearings".
Bearings shall be seated in accordance with subsection 808.08. This work and materials are considered subsidary to the item "Elastomeric Bearings" and will not be paid for directly.

Unless otherwise approved by the Engineer, welding of the external load plate at expansion bearings to the girder will be allowed only when 1) the approximate average air temperature during the 24 hour period immediately proceeding welding is between 40°F and 80°F; and 2) the slots in the external load plate are positioned to center on the anchor bolts; and 3) no horizontal deformation of the elastomeric pad is evident. If welding at other temperatures is required, the engineer will provide adjustment data.

POURING SEQUENCE UNIT 2

SCALE: 1/16" = 1'-0"

Notes:

Required slab joints and pouring sequence construction joints shall align with open joints at the front face of the parapets.

For each stage of construction, pours must be made in order as numbered. Pours with the same number may be placed simultaneously or separately. 48 hours shall elapse between the end of a pour and the start of the next pour. 72 hours shall elapse between the end of a pour and the start of the adjacent pour. 72 hours shall elapse between the end of a deck pour and the start of a sidewalk pour. 72 hours shall elapse between the end of a sidewalk pour and the start of a parapet railing pour. Any sidewalk or railing pours made before the entire slab unit has been placed must be approved by the Engineer. Concrete in bridge superstructure shall be consolidated for the entire pour before any concrete has taken its initial set. This may require the use of a retarding agent.

The Contractor must obtain approval from the Engineer for any deviations from the pouring sequence shown.

All longitudinal dimensions measured to centerline of joint.

Pours with the same number may be placed simultaneously or separately. 48 hours shall elapse between the end of a pour and the start of the next pour. 72 hours shall elapse between the end of a pour and the start of the adjacent pour. 72 hours shall elapse between the end of a deck pour and the start of a sidewalk pour. 72 hours shall elapse between the end of a sidewalk pour and the start of a parapet railing pour. Any sidewalk or railing pours made before the entire slab unit has been placed must be approved by the Engineer. Concrete in bridge superstructure shall be consolidated for the entire pour before any concrete has taken its initial set. This may require the use of a retarding agent.

The Contractor must obtain approval from the Engineer for any deviations from the pouring sequence shown.

All longitudinal dimensions measured to centerline of joint.

(1) Parapet panel spacing measured along front face of parapet and intersecting at C.L. Deck Joint opening or C.L. Bent.

(2) Dimensions measured along horizontal control line.

(3) Dimensions measured along edge of deck and intersecting at C.L. Deck Joint opening or C.L. Bent.

(4) Dimensions measured along centerline of joint.

(P) C.L. Partial Depth Parapet Joint (1/4" to 1" max.). Stop 1'-6" from top of slab. See Dwg. No. 59841

(F) C.L. Full Depth Parapet Joint (1/4" to 1" max.). Stop 4" from top of slab. See Dwg. No. 59841

① Care shall be taken to ensure that the external load plate is in full and complete contact with the beam flange before welding begins.

② Thus the C.L. of Bearings shall coincide with the C.L. of Beams.

Note:
The direction of bevel of the external load plate may not be accurately depicted with respect to the "T(a)" and "T(b)" values shown in the "Table of Fabricator Variables."

NOTE:
Anchor bolts may be cast in place or drilled and grouted into place. If Anchor Bolts are to be cast in place, the Galvanized Sheet Metal Sleeves will not be required. If Anchor bolts are to be drilled and grouted in place, the Galvanized Sheet Metal Sleeves shall be cast in place as shown. Sleeves shall be dry packed with Styrofoam, urethane foam or approved equal prior to pouring of concrete. After pouring of the cap and prior to erection of Structural Steel, the dry pack shall be removed and holes for the anchor bolts shall be accurately drilled into the masonry. Bolts placed in drilled holes shall be accurately set fixed using a OPL approved epoxy or non-shrink grout that completely fills the holes. Galvanized Sheet Metal Sleeves will not be paid for directly but will be considered subsidiary to the item "Structural Steel in Beam Spans, (M 270, Gr. 50W)".

GENERAL NOTES:
Elastomeric bearings shall conform to Section 808 of the Standard Specifications and shall be paid for at the unit price bid for "Elastomeric Bearings."

External load plates and shear blocks shall conform to AASHTO M 270, Grade 50. Pipe sleeves shall be ASTM A500, Grade B, and shall be galvanized to conform to AASHTO M 232, Class C or ASTM B695, class 50.

External load plates with shear blocks shall be completely fabricated (including bevel and bolt holes) and shall be cleaned before vulcanizing to the elastomeric bearing. The surface in contact with the elastomeric bearing shall be cleaned in accordance with Section 808.03. Other surfaces shall be blast cleaned in accordance with subsection 807.84(b) for painted steel.

External load plates and shear blocks shall be painted in accordance with Section 807.75. The color of the paint shall be brown and shall match Fed. Std. 595B, Color Chip No. 20108. Mask areas that are to be welded in the field.

Anchor Bolts and Nuts shall conform to subsection 807.07 of the Standard Specifications. Steel Washers shall conform to AASHTO M 270, Grade 50. The anchor bolt grade of steel shall be as specified in the "Table of Fabricator Variables". Indentations shall be circular with rounded bottoms and staggered as shown in the details.

Pipe Sleeves, Anchor Bolts, Washers, and Nuts shall be paid for at the unit price bid for "Structural Steel in Beam Spans, (M 270, Gr. 50W)". External load plates and blocks will not be measured or paid for separately, but will be considered incidental to the unit price bid for "Elastomeric Bearings".
Bearings shall be seated in accordance with subsection 808.08. This work and materials are considered subsidary to the item "Elastomeric Bearings" and will not be paid for directly.

Unless otherwise approved by the Engineer, welding of the external load plate at expansion bearings to the girder will be allowed only when 1) the approximate average air temperature during the 24 hour period immediately preceeding welding is between 40°F and 80°F; and 2) the slots in the external load plate are positioned to center on the anchor bolts; and 3) no horizontal deformation of the elastomeric pad is evident. If welding at other temperatures is required, the engineer will provide adjustment data.

(1) For fabrication of the Steel Washers when the tabulated O.D. exceeds ASTM F436, the I.D. of the washers shall conform to ASTM F436 and the thickness of 7/8" shall be used.

NOTE:
Anchor bolts may be cast in place or drilled and grouted into place. If Anchor Bolts are to be cast in place, the Galvanized Sheet Metal Sleeves will not be required. If Anchor bolts are to be drilled and grouted in place, the Galvanized Sheet Metal Sleeves shall be cast in place as shown. Sleeves shall be dry packed with Styrofoam, urethane foam or approved equal prior to pouring of concrete. After pouring of the cap and prior to erection of Structural Steel, the dry pack shall be removed and holes for the anchor bolts shall be accurately drilled into the masonry. Bolts placed in drilled holes shall be accurately set fixed using a DPL approved epoxy or non-shrink grout that completely fills the holes. Galvanized Sheet Metal Sleeves will not be paid for directly but will be considered subsidiary to the item "Structural Steel In Beam Spans, (M 270, Gr. 50W)".

GENERAL NOTES:
Elastomeric bearings shall conform to Section 808 of the Standard Specifications and shall be paid for at the unit price bid for "Elastomeric Bearings."

External load plates and shear blocks shall conform to AASHTO M 270, Grade 50. Pipe sleeves shall be ASTM A500, Grade B, and shall be galvanized to conform to AASHTO M 232, Class C or ASTM B695, class 50.

External load plates with shear blocks shall be completely fabricated (including bevel and bolt holes) and shall be cleaned before vulcanizing to the elastomeric bearing. The surface in contact with the elastomeric bearing shall be cleaned in accordance with Section 808.03. Other surfaces shall be blast cleaned in accordance with subsection 807.84(b) for painted steel.

External load plates and shear blocks shall be painted in accordance with Section 807.75. The color of the paint shall be brown and shall match Fed. Std. 595B, Color Chip No. 20108. Mask areas that are to be welded in the field.

Anchor Bolts and Nuts shall conform to subsection 807.07 of the Standard Specifications. Steel Washers shall conform to AASHTO M 270, Grade 50. The anchor bolt grade of steel shall be as specified in the "Table of Fabricator Variables". Indentations shall be circular with rounded bottoms and staggered as shown in the details.

Pipe Sleeves, Anchor Bolts, Washers, and Nuts shall be paid for at the unit price bid for "Structural Steel In Beam Spans, (M 270, Gr. 50W)". External load plates and blocks will not be measured or paid for separately, but will be considered incidental to the unit price bid for "Elastomeric Bearings".
Bearings shall be seated in accordance with subsection 808.08. This work and materials are considered subsidiary to the item "Elastomeric Bearings" and will not be paid for directly.

Unless otherwise approved by the Engineer, welding of the external load plate at expansion bearings to the girder will be allowed only when 1) the approximate average air temperature during the 24 hour period immediately preceeding welding is between 40°F and 80°F; and 2) the slots in the external load plate are positioned to center on the anchor bolts; and 3) no horizontal deformation of the elastomeric pad is evident. If welding at other temperatures is required, the engineer will provide adjustment data.

STEEL PILING: Piling shall be HP 12x53 (Grade 50) for End Bents and HP 14x102 (Grade 50) for Intermediate Bents 2, 13, & 14 and paid for as "Steel Piling (HP 12x53)" and "Steel Piling (HP 14x102)" respectively per pile.

PREBORING: Preboring may be required to obtain the minimum pile penetration of 10', if required, preboring at bents shall take place after excavation to hard strata is complete and shall be to a minimum depth of X' into the hard strata material designated as shale on the boring legend. The size and depth of preboring, will be determined in the field by the Engineer. The Contractor shall be responsible for keeping the prebored holes free from debris prior to backfilling which may require the use of temporary casings or other methods. After driving is completed, the prebored hole shall be backfilled with Class S Concrete to the top of rock and the remaining length of prebored holes shall be backfilled with material specified in Subsection 805.08 or other approved material, unless otherwise noted, to completely fill voids. The cost of preboring, temporary casings, and backfill will not be paid for directly but will be considered subsidiary to the Item "PREBORING".

DRILLED SHAFTS: Foundations for Intermediate Bents 3-12 shall consist of Drilled Shafts. All Drilled Shafts shall be founded into competent material designated as shale on the boring legend to the minimum rock penetrations and tip elevations shown in the plans. No adjustments in Plan Tip Elevation shall be made without prior approval from the Engineer. Methods of construction of the drilled shafts shall be in accordance with SP CA0601 "Drilled Shaft Foundations". Permanent casing shall be used for construction of the drilled shafts, such as to prevent caving, to exclude groundwater, or to provide shoring, and shall not extend below top of rock. The Contractor must obtain approval from the Engineer for any deviation from this requirement.

Drilled shaft reinforcing shall be secured in place before concrete placement. Concrete and reinforcing steel in drilled shafts, including column dowels, will not be paid for directly but will be included in the unit prices of the drilled shaft items.

For construction methods, materials, measurement and payment of drilled shafts, see Job CA0601 Special Provision "Drilled Shaft Foundations.

For additional information, see bridge layout and detail drawings.

CROSSHOLE SONIC LOGGING: Nondestructive testing shall be performed on specific drilled shafts in accordance with SP CA0601 "Nondestructive Testing of Drilled Shafts".

EXISTING BRIDGE: Existing Bridge Nos. A3094 and B3094 (log M4.38) are 1,063' long consisting of five composite W-Beam and nine Composite Plate Girder simple spans supported by substructures consisting of R.C. Int. Bents with multi-columns on spread footings and Pile Trestle and End Bents. The existing bridges are located in approximately the same location as the proposed bridge. Plans can be obtained upon request from the Construction Contract Procurement Section of the Program Management Division.

REMOVAL AND SALVAGE: The new bridges are to be built in stages and existing Bridge Nos. A&B3094 shall be removed in accordance with Section 205. Stage removal of Bridge No. A3094 will be required for Stage 1 & 3 Construction. Stage removal of Bridge No. B3094 will be required for Stage 2 Construction. All material from the existing bridge shall become the property of the Contractor.

STRUCTURAL STEEL: Structural steel shall be AASHTO M270,Gr.50W unless otherwise noted and shall be paid for as "Structural Steel in Beam Spans (M270,Gr.50W)" & "Structural Steel in Plate Girder Spans (M270,Gr.50W)".

REINFORCING PLAN & POURING SEQUENCE

SCALE: 1/16" = 1'-0"

Notes:

Required slab joints and pouring sequence construction joints shall align with open joints at the front face of the parapets.

For each stage of construction, pours must be made in order as numbered. Pours with the same number may be placed simultaneously or separately. 48 hours shall elapse between the end of a pour and the start of the next pour. 72 hours shall elapse between the end of a pour and the start of the adjacent pour. 72 hours shall elapse between the end of a deck pour and the start of a sidewalk pour. 72 hours shall elapse between the end of a sidewalk pour and the start of a parapet railing pour. Any sidewalk or railing pours made before the entire slab unit has been placed must be approved by the Engineer. Concrete in bridge superstructure shall be consolidated for the entire pour before any concrete has taken its initial set. This may require the use of a retarding agent.

The Contractor must obtain approval from the Engineer for any deviations from the pouring sequence shown.

All longitudinal dimensions measured to centerline of joint or transverse reinforcing.

(1) Parapet panel spacing measured along front face of parapet and intersecting at C.L. Deck Joint opening or C.L. Bent.

(2) Dimensions measured along horizontal control line.

(3) Dimensions measured along edge of deck and intersecting at C.L. Deck Joint opening or C.L. Bent.

(4) Dimensions measured along centerline of joint.

(5) Min. Laps for splices applicable to longitudinal and transverse reinforcing are as follows:
- #4 bars = 2'-7"
- #5 bars = 3'-3"
- #6 bars = 3'-10"

(6) Spaced equally between every other top transervse bar as shown.

(7) For placement, refer to TYPICAL ROADWAY SECTION on Dwg. No. 59877

(8) For Section T-T, see Dwg. No. 59904

(P) C.L. Partial Depth Parapet Joint (¼" to 1" max.). Stop 1'-6" from top of slab. See Dwg. No. 59905

(F) C.L. Full Depth Parapet Joint (¼" to 1" max.). Stop 4" from top of slab. See Dwg. No. 59905

(A) See "ADJUSTMENT FOR SLAB THICKNESS TOLERANCE", Std. Dwg. No. 55007. Minimum occurs when top flange is 1/4" from bottom reinforcing steel; Maximum = top flange thickness plus 2 1/8".

(B) Tolerance: Minus = 1/4". Plus equal to amount of slab thickening used to meet thickness tolerance. See "ADJUSTMENT FOR SLAB THICKNESS TOLERANCE", Std. Dwg. No. 55007.

(C) Provide Poured Silicone Joints at End Bents and Neoprene Strip Seal Joints with Steel Extrusion at Bents 5, 8 & 12. For Joint Data Tables, see Dwg. No. 59865

For "LONGITUDINAL CONSTRUCTION JOINT" detail, see Std. Dwg. No. 55007

(D) Diaphragms between girders 3 & 4 shall be installed with bolts loose when girders are erected in Stage 2. Bolts shall be fully tightened immediately after placing slab in Stage 2.

Alternatively, the holes in the connection plate of one side of these diaphragms may be field drilled after placing slab in Stage 2.

REINFORCING PLAN & POURING SEQUENCE

SCALE: 1/16" = 1'-0"

Notes:

Required slab joints and pouring sequence construction joints shall align with open joints at the front face of the parapets.

For each stage of construction, pours must be made in order as numbered. Pours with the same number may be placed simultaneously or separately. 48 hours shall elapse between the end of a pour and the start of the next pour. 72 hours shall elapse between the end of a pour and the start of the adjacent pour. 72 hours shall elapse between the end of a deck pour and the start of a sidewalk pour. 72 hours shall elapse between the end of a sidewalk pour and the start of a parapet railing pour. Any sidewalk or railing pours made before the entire slab unit has been placed must be approved by the Engineer. Concrete in bridge superstructure shall be consolidated for the entire pour before any concrete has taken its initial set. This may require the use of a retarding agent.

The Contractor must obtain approval from the Engineer for any deviations from the pouring sequence shown.

All longitudinal dimensions measured to centerline of joint or transverse reinforcing.

(1) Parapet panel spacing measured along front face of parapet and intersecting at C.L. Deck Joint opening or C.L. Bent.

(2) Dimensions measured along horizontal control line.

(3) Dimensions measured along edge of deck and intersecting at C.L. Deck Joint opening or C.L. Bent.

(4) Dimensions measured along centerline of joint.

(5) Min. Laps for splices applicable to longitudinal and transverse reinforcing are as follows:
- #4 bars = 2'-7"
- #5 bars = 3'-3"
- #6 bars = 3'-10"

(6) Spaced equally between every other top transervse bar as shown.

(7) For placement, refer to TYPICAL ROADWAY SECTION on Dwg. No. 59881

(8) For Section T-T, see Dwg. No. 59904

Notes:

Required slab joints and pouring sequence construction joints shall align with open joints at the front face of the parapets.

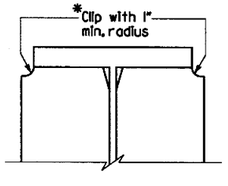
For each stage of construction, pours must be made in order as numbered. Pours with the same number may be placed simultaneously or separately. 48 hours shall elapse between the end of a pour and the start of the next pour. 72 hours shall elapse between the end of a pour and the start of the adjacent pour. 72 hours shall elapse between the end of a deck pour and the start of a sidewalk pour. 72 hours shall elapse between the end of a sidewalk pour and the start of a parapet railing pour. Any sidewalk or railing pours made before the entire slab unit has been placed must be approved by the Engineer. Concrete in bridge superstructure shall be consolidated for the entire pour before any concrete has taken its initial set. This may require the use of a retarding agent.

The Contractor must obtain approval from the Engineer for any deviations from the pouring sequence shown.

All longitudinal dimensions measured to centerline of joint or transverse reinforcing.

(1) Parapet panel spacing measured along front face of parapet and intersecting at C.L. Deck Joint opening or C.L. Bent.
(2) Dimensions measured along horizontal control line.
(3) Dimensions measured along edge of deck and intersecting at C.L. Deck Joint opening or C.L. Bent.
(4) Dimensions measured along centerline of joint.
(5) Min. Laps for splices applicable to longitudinal and transverse reinforcing are as follows:
- #4 bars = 2'-7"
- #5 bars = 3'-3"
- #6 bars = 3'-10"

(6) Spaced equally between every other top transervse bar as shown.
(7) For placement, refer to TYPICAL ROADWAY SECTION on Dwg. No. 59896
(8) For Section T-T, see Dwg. No. 59904
(P) C.L. Partial Depth Parapet Joint (¼" to 1" max.). Stop 1'-6" from top of slab. See Dwg. No. 59905
(F) C.L. Full Depth Parapet Joint (¼" to 1" max.). Stop 4" from top of slab. See Dwg. No. 59905



* If permanent steel bridge deck forms are used, the fabricator shall clip the plate as necessary to accommodate the deck form support.

REINFORCING PLAN & POURING SEQUENCE

SCALE: 1/16" = 1'-0"

Notes:

Required slab joints and pouring sequence construction joints shall align with open joints at the front face of the parapets.

For each stage of construction, pours must be made in order as numbered. Pours with the same number may be placed simultaneously or separately. 48 hours shall elapse between the end of a pour and the start of the next pour. 72 hours shall elapse between the end of a pour and the start of the adjacent pour. 72 hours shall elapse between the end of a deck pour and the start of a sidewalk pour. 72 hours shall elapse between the end of a sidewalk pour and the start of a parapet railing pour. Any sidewalk or railing pours made before the entire slab unit has been placed must be approved by the Engineer. Concrete in bridge superstructure shall be consolidated for the entire pour before any concrete has taken its initial set. This may require the use of a retarding agent.

The Contractor must obtain approval from the Engineer for any deviations from the pouring sequence shown.

All longitudinal dimensions measured to centerline of joint or transverse reinforcing.

(1) Parapet panel spacing measured along front face of parapet and intersecting at C.L. Deck Joint opening or C.L. Bent.

(2) Dimensions measured along horizontal control line.

(3) Dimensions measured along edge of deck and intersecting at C.L. Deck Joint opening or C.L. Bent.

(4) Dimensions measured along centerline of joint.

(5) Min. Laps for splices applicable to longitudinal and transverse reinforcing are as follows:
- #4 bars = 2'-7"
- #5 bars = 3'-3"
- #6 bars = 3'-10"

(6) Spaced equally between every other top transervse bar as shown.

(7) For placement, refer to TYPICAL ROADWAY SECTION on Dwg. No. 59900

(8) For Section T-T, see Dwg. No. 59904

(P) C.L. Partial Depth Parapet Joint (1/4" to 1" max.). Stop 1'-6" from top of slab. See Dwg. No. 59905

(F) C.L. Full Depth Parapet Joint (1/4" to 1" max.). Stop 4" from top of slab. See Dwg. No. 59905

All panels shall be braced as shown to prevent racking. All open joints shall be sawed as soon as practical to a minimum width of ¼". To control cracking before sawing, all joints must be grooved before the concrete is set. Sawing of the joints must be controlled so it will follow the grooved joint.

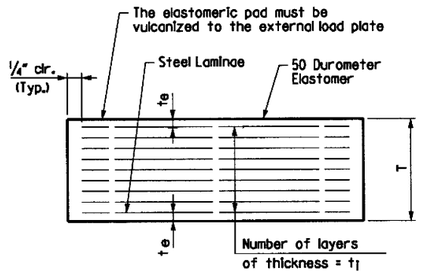
ELASTOMERIC BEARING
(No Scale)



t_l = thickness of elastomer between steel laminae.
t_e = thickness of elastomer cover on top and bottom of pad.
N = number of elastomer layers of thickness t_l.

(1) Care shall be taken to ensure that the external load plate is in full and complete contact with the beam or girder flange before welding begins.

(2) Thus the C.L. of Bearings shall coincide with the C.L. of Girders.

Note:
The direction of bevel of the external load plate may not be accurately depicted with respect to the "T(a)" and "T(b)" values shown in the "Table of Fabricator Variables."

NOTE:
Anchor bolts may be cast in place or drilled and grouted into place. If Anchor Bolts are to be cast in place, the Galvanized Sheet Metal Sleeves will not be required. If Anchor bolts are to be drilled and grouted in place, the Galvanized Sheet Metal Sleeves shall be cast in place as shown. Sleeves shall be dry packed with Styrofoam, urethane foam or approved equal prior to pouring of concrete. After pouring of the cap and prior to erection of Structural Steel, the dry pack shall be removed and holes for the anchor bolts shall be accurately drilled into the masonry. Bolts placed in drilled holes shall be accurately set fixed using a OPL approved epoxy or non-shrink grout that completely fills the holes. Galvanized Sheet Metal Sleeves will not be paid for directly but will be considered subsidiary to the item "Structural Steel in Plate Girder Spans, (M 270, Gr. 50W)" or "Structural Steel in Beam Spans, (M 270, Gr. 50W)".

GENERAL NOTES:
Elastomeric bearings shall conform to Section 808 of the Standard Specifications and shall be paid for at the unit price bid for "Elastomeric Bearings."

External load plates and shear blocks shall conform to AASHTO M 270, Grade 50. Pipe sleeves shall be ASTM A500, Grade B, and shall be galvanized to conform to AASHTO M 232, Class C or ASTM B695, class 50.

External load plates with shear blocks shall be completely fabricated (including bevel and bolt holes) and shall be cleaned before vulcanizing to the elastomeric bearing. The surface in contact with the elastomeric bearing shall be cleaned in accordance with Section 808.03. Other surfaces shall be blast cleaned in accordance with subsection 807.84(b) for painted steel.

External load plates and shear blocks shall be painted in accordance with Section 807.75. The color of the paint shall be brown and shall match Fed. Std. 595B, Color Chip No. 20108. Mask areas that are to be welded in the field.

Anchor Bolts and Nuts shall conform to subsection 807.07 of the Standard Specifications. Steel Washers shall conform to AASHTO M 270, Grade 50. The anchor bolt grade of steel shall be as specified in the "Table of Fabricator Variables". Indentations shall be circular with rounded bottoms and staggered as shown in the details.

Pipe Sleeves, Anchor Bolts, Washers, and Nuts shall be paid for at the unit price bid for "Structural Steel in Plate Girder Spans, (M 270, Gr. 50W)" or "Structural Steel in Beam Spans, (M 270, Gr. 50W)". External load plates and blocks will not be measured or paid for separately, but will be considered incidental to the unit price bid for "Elastomeric Bearings".
Bearings shall be seated in accordance with subsection 808.08. This work and materials are considered subsidary to the item "Elastomeric Bearings" and will not be paid for directly.

Unless otherwise approved by the Engineer, welding of the external load plate at expansion bearings to the girder will be allowed only when 1) the approximate average air temperature during the 24 hour period immediately preceeding welding is between 40°F and 80°F; and 2) the slots in the external load plate are positioned to center on the anchor bolts; and 3) no horizontal deformation of the elastomeric pad is evident. If welding at other temperatures is required, the engineer will provide adjustment data.

① For fabrication of the Steel Washers when the tabulated O.D. exceeds ASTM F436, the I.D. of the washers shall conform to ASTM F436 and the thickness of 3/8" shall be used.

NOTE:
Anchor bolts may be cast in place or drilled and grouted into place. If Anchor Bolts are to be cast in place, the Galvanized Sheet Metal Sleeves will not be required. If Anchor bolts are to be drilled and grouted in place, the Galvanized Sheet Metal Sleeves shall be cast in place as shown. Sleeves shall be dry packed with Styrofoam, urethane foam or approved equal prior to pouring of concrete. After pouring of the cap and prior to erection of Structural Steel, the dry pack shall be removed and holes for the anchor bolts shall be accurately drilled into the masonry. Bolts placed in drilled holes shall be accurately set fixed using a QPL approved epoxy or non-shrink grout that completely fills the holes. Galvanized Sheet Metal Sleeves will not be paid for directly but will be considered subsidiary to the item "Structural Steel in Plate Girder Spans, (M 270, Gr. 50W)" or "Structural Steel in Beam Spans, (M 270, Gr. 50W)".

GENERAL NOTES:
Elastomeric bearings shall conform to Section 808 of the Standard Specifications and shall be paid for at the unit price bid for "Elastomeric Bearings."

External load plates and shear blocks shall conform to AASHTO M 270, Grade 50. Pipe sleeves shall be ASTM A500, Grade B, and shall be galvanized to conform to AASHTO M 232, Class C or ASTM B695, class 50.

External load plates with shear blocks shall be completely fabricated (including bevel and bolt holes) and shall be cleaned before vulcanizing to the elastomeric bearing. The surface in contact with the elastomeric bearing shall be cleaned in accordance with Section 808.03. Other surfaces shall be blast cleaned in accordance with subsection 807.84(b) for painted steel.

External load plates and shear blocks shall be painted in accordance with Section 807.75. The color of the paint shall be brown and shall match Fed. Std. 595B, Color Chip No. 20108. Mask areas that are to be welded in the field.

Anchor Bolts and Nuts shall conform to subsection 807.07 of the Standard Specifications. Steel Washers shall conform to AASHTO M 270. Grade 50. The anchor bolt grade of steel shall be as specified in the "Table of Fabricator Variables". Indentations shall be circular with rounded bottoms and staggered as shown in the details.

Pipe Sleeves, Anchor Bolts, Washers, and Nuts shall be paid for at the unit price bid for "Structural Steel in Plate Girder Spans, (M 270, Gr. 50W)" or "Structural Steel in Beam Spans, (M 270, Gr. 50W)". External load plates and blocks will not be measured or paid for separately, but will be considered incidental to the unit price bid for "Elastomeric Bearings".
Bearings shall be seated in accordance with subsection 808.08. This work and materials are considered subsidary to the item "Elastomeric Bearings" and will not be paid for directly.

Unless otherwise approved by the Engineer, welding of the external load plate at expansion bearings to the girder will be allowed only when 1) the approximate average air temperature during the 24 hour period immediately preceeding welding is between 40°F and 80°F; and 2) the slots in the external load plate are positioned to center on the anchor bolts; and 3) no horizontal deformation of the elastomeric pad is evident. If welding at other temperatures is required, the engineer will provide adjustment data.

PLAN

Horizontal control stationing is defined along C.L. South St., see RDWY plans.
Vertical control Profile Grade is coincident with C.L. South St.
C.L. Bridge is 1'-9" left of C.L. South St.
C.L. Bridge and all longitudinal edges, except right wing of Bent 1, are horizontally parallel to C.L. South St.
ELEVATION view: stationing, total bridge length, span lengths, and C.L. Joint to Beginning and End of Bridge dimensions are measured along C.L. of Bridge, with stationing derived by perpendicular projection from C.L. South St.
Proposed Grade deck elevations shown, are along C.L. Bridge, on the Theoretical Roadway Grade, left of Working Point, above Top of Rdwy Surface. See "ROUNDING DETAIL" on Std. Dwg. No. 55007

Note:
Remove existing concrete riprap and replace with new concrete riprap as shown for bent construction (See Std. Dwg. No. 55002). Payment for this work shall be considered subsidiary to the pay item "Removal of Existing Bridge Structures".

GENERAL NOTES

For Project Bridge General Notes Sheet, see Dwg. No. 59691 . General notes specific to this bridge follow.

STEEL PILING:
Piling shall be HP 12x53 (Grade 50) for each End Bent and shall be paid for as "Steel Piling (HP 12x53)". Pile casings are required for all pile within MSE. Casings shall be installed prior to or during the embankment construction and shall extend from top of leveling pad to bottom of cap. Pile casing material shall be of sufficient strength to retain its original form, free from harmful distortions after compaction of the fill material surrounding it. The minimum inside diameter of the casing shall be 18" for HP 12x53. Piles shall be driven through the open casings. After driving is complete, the pile casings shall be filled with Class S Concrete, an approved non-shrink grout, mixture used for Portland Cement Concrete Pavement, or other approved material in a single continuous operation to completely fill voids. Pile casings and concrete will not be paid for directly but shall be considered subsidiary to the item "Steel Piling (HP 12x53)".

DRILLED SHAFTS: Foundations for intermediate Bents 2-4 shall consist of Drilled Shafts. All Drilled Shafts shall be founded into competent material designated as shale on the boring legend to the minimum rock penetrations and tip elevations shown in the plans. No adjustments in Plan Tip Elevation shall be made without prior approval from the Engineer. Methods of construction of the drilled shafts shall be in accordance with SP CA0601 "Drilled Shaft Foundations". Permanent casing shall be used for construction of the drilled shafts, such as to prevent caving, to exclude groundwater, or to provide shoring, and shall not extend below top of rock. The Contractor must obtain approval from the Engineer for any deviation from this requirement.

Drilled shaft and column dowels reinforcing shall be secured in place before concrete placement. Concrete and reinforcing steel in drilled shafts, including projection of drilled shaft bars into column, will not be paid for directly but will be included in the unit prices of the drilled shaft items.

For construction methods, materials, measurement and payment of drilled shafts, see Job CA0601 Special Provision "Drilled Shaft Foundations".

For additional information, see bridge layout and detail drawings.

CROSSHOLE SONIC LOGGING: Nondestructive testing shall be performed on specific drilled shafts in accordance with SP CA0601 "Nondestructive Testing of Drilled Shafts".

TEXTURED COATING FINISH: Class 3 Textured Coating Finish shall be applied to bridge surfaces as specified in Special Provision Job No. CA0601 "Textured Coating Finish" and in accordance with subsection 802.19(b)(3). Textured Coating Finish shall not be applied on surfaces where Class I Protective Surface Treatment is applied.

PAINT: All structural steel except galvanized members and some surfaces in contact with concrete, and as otherwise noted, shall be cleaned in accordance with Section 807.84(b) and painted as specified in Subsection 807.75. Color of paint shall be DARK BROWN and shall match Fed. Std. 595B, Color Chip No. 20108.

POWDER COATING: All metal bridge railing shall recieve a powder coating finish. Color shall be Dark Bronze as approved by the Engineer. See Std. Dwg. No. 55014 for additional information.

Bents with multi-columns on spread footings and Pile End Bents. The existing bridge is located in approximately the same location as the proposed bridge. Plans can be obtained upon request from the Construction Contract Procurement Section of the Program Management Division.

REMOVAL AND SALVAGE: The new bridge is to be built in stages and existing Bridge No. 3141R shall be removed in accordance with Section 205. Stage removal of Bridge No. 3141R will be required for Stage 1 & 2 Construction. All material from the existing bridge shall become the property of the Contractor.

STRUCTURAL STEEL: Structural steel shall be AASHTO M270, Gr.50 unless otherwise noted and shall be paid for as "Structural Steel in Beam Spans (M270, Gr.50)".

Notes:

Required slab joints and pouring sequence construction joints shall align with open joints at the front face of the parapets.

For each stage of construction, pours must be made in order as numbered. Pours with the same number may be placed simultaneously or separately. 48 hours shall elapse between the end of a pour and the start of the next pour. 72 hours shall elapse between the end of a pour and the start of the adjacent pour. 72 hours shall elapse between the end of a deck pour and the start of a sidewalk pour. 72 hours shall elapse between the end of a sidewalk pour and the start of a parapet railing pour. Any sidewalk or railing pours made before the entire slab unit has been placed must be approved by the Engineer. Concrete in bridge superstructure shall be consolidated for the entire pour before any concrete has taken its initial set. This may require the use of a retarding agent.

The Contractor must obtain approval from the Engineer for any deviations from the pouring sequence shown.

For Bar List, see Dwg. No. 59929

For Parapet Details See Dwg. No. 59934

See Deck Joint and Concrete Placement Details on Std. Dwg. No. 55007.

(1) Care shall be taken to ensure that the external load plate is in full and complete contact with the beam or girder flange before welding begins.

(2) Thus the C.L. of Bearings shall coincide with the C.L. of Girders.

(3) For fabrication of the Steel Washers when the tabulated O.D. exceeds ASTM F436, the I.D. of the washers shall conform to ASTM F436 and the thickness of 3/8" shall be used.

Note:
The direction of bevel of the external load plate may not be accurately depicted with respect to the "T(a)" and "T(b)" values shown in the "Table of Fabricator Variables."

NOTE:
Anchor bolts may be cast in place or drilled and grouted into place. If Anchor Bolts are to be cast in place, the Galvanized Sheet Metal Sleeves will not be required. If Anchor bolts are to be drilled and grouted in place, the Galvanized Sheet Metal Sleeves shall be cast in place as shown. Sleeves shall be dry packed with Styrofoam, urethane foam or approved equal prior to pouring of concrete. After pouring of the cap and prior to erection of Structural Steel, the dry pack shall be removed and holes for the anchor bolts shall be accurately drilled into the masonry. Bolts placed in drilled holes shall be accurately set fixed using a DPL approved epoxy or non-shrink grout that completely fills the holes. Galvanized Sheet Metal Sleeves will not be paid for directly but will be considered subsidiary to the item "Structural Steel in Beam Spans, (M 270, Gr. 50)".

GENERAL NOTES:
Elastomeric bearings shall conform to Section 808 of the Standard Specifications and shall be paid for at the unit price bid for "Elastomeric Bearings."

External load plates and shear blocks shall conform to AASHTO M 270, Grade 50. Pipe sleeves shall be ASTM A500, Grade B, and shall be galvanized to conform to AASHTO M 232, Class C or ASTM B695, class 50.

External load plates with shear blocks shall be completely fabricated (including bevel and bolt holes) and shall be cleaned before vulcanizing to the elastomeric bearing. The surface in contact with the elastomeric bearing shall be cleaned in accordance with Section 808.03. Other surfaces shall be blast cleaned in accordance with subsection 807.84(b) for painted steel.

External load plates and shear blocks shall be painted in accordance with Section 807.75. The color of the paint shall be brown and shall match Fed. Std. 595B, Color Chip No. 20108. Mask areas that are to be welded in the field.

Anchor Bolts and Nuts shall conform to subsection 807.07 of the Standard Specifications. Steel Washers shall conform to AASHTO M 270, Grade 50. The anchor bolt grade of steel shall be as specified in the "Table of Fabricator Variables". Indentations shall be circular with rounded bottoms and staggered as shown in the details.

Pipe Sleeves, Anchor Bolts, Washers, and Nuts shall be paid for at the unit price bid for "Structural Steel in Beam Spans, (M 270, Gr. 50)". External load plates and blocks will not be measured or paid for separately, but will be considered incidental to the unit price bid for "Elastomeric Bearings".
Bearings shall be seated in accordance with subsection 808.08. This work and materials are considered subsidiary to the item "Elastomeric Bearings" and will not be paid for directly.

Unless otherwise approved by the Engineer, welding of the external load plate at expansion bearings to the girder will be allowed only when 1) the approximate average air temperature during the 24 hour period immediately preceeding welding is between 40°F and 80°F; and 2) the slots in the external load plate are positioned to center on the anchor bolts; and 3) no horizontal deformation of the elastomeric pad is evident. If welding at other temperatures is required, the engineer will provide adjustment data.

* Note: The Contractor shall make field measurements to determine the column heights 'H1' & 'H2' that are required to maintain the minimum vertical clearance at the critical point. These column heights shall be shown on the shop drawings with a note stating that the Contractor has made the required field measurements.

If the structure height ('H1' or 'H2') exceeds 30'-0" contact the engineer. The Contractor shall also verify that the variable span length (75'-0" to 95'-0") is sufficient to meet the minimum clearances and to fit the new structure to the existing and/or proposed conditions.

All steel shall be Galvanized according to Subsection 807.19. Steel completely encased in concrete may not be Galvanized. Galvanized Coating damaged during transport, handling, or erection shall be field repaired in accordance with Subsection 807.88.

Drawings show general features of design only. Shop drawings shall be made in accordance with Subsection 807.04, submitted, and approval secured before fabrication is begun.

No circumferential butt welds or helical lap splices will be allowed in any pipe sections.

Requests for substitution of structural steel shapes shown with shapes of greater size must be submitted by the Contractor to the Engineer for approval. Steels of equal or greater strengths will be accepted only when shown on the approved shop drawings. Shapes and materials shown in the plans will be the basis of payment and no additional compensation will be made for any adjustments due to substitutions.

Connections shall be bolted with high-strength bolts. Unless noted otherwise, bolts shall be $\frac{5}{8}$" diameter and open holes shall be $\frac{11}{16}$". Bolt spacing shall be $2\frac{1}{2}$" for $\frac{5}{8}$" diameter bolts unless otherwise noted. Bolts shall be placed with heads on the outside face of all members.

All welding that is to be done during fabrication of structural steel, including temporary welds, shall be detailed on the shop drawings and submitted for approval. If additional welds are required, whether temporary or permanent, a formal request with detailed drawings shall be submitted to the Engineer for approval. All welding shall conform to Subsection 807.26.

Anchor bolts shall comply with AASHTO M314, Grade 55, with Supplementary Requirement S1, and galvanized according to Subsection 807.07. Nuts and washers for anchor bolts shall be furnished and galvanized in accordance with Subsection 807.07.

Field splices shall be located in order to avoid sign panel connections. There shall be a maximum of two field splices and they shall be spaced a minimum of 15 ft. apart.

All main load carrying tension members greater than ½" in thickness shall conform to the requirements of the Longitudinal Charpy V-notch test specified for Zone 1 minimum service temperature. This work and materials shall be paid for in accordance with Special Provision Job CA0601 "STEEL SIGN STRUCTURES".

All fillet welds of critical members shall be tested according to AWS D1.1 Structural Welding Code - Steel, using the magnetic particle method. Critical welds shall include: column to base plate and truss bottom support to column.

Truss field sections shall be shop assembled. Entire truss shall be fully assembled and lifted into place as one unit on to tower supports.

All truss member field connections shall be bolted connections.

Lock nuts to be equipped with nylon locking inserts or other approved type locking system. Locknuts to be installed according to manufacturer's recommendations.

The excavations for the footings shall be back-filled before the structure is attached to the foundations.

The contractor shall make check measurements in the field and subject to the approval of the Engineer, make any adjustments necessary to meet the required clearances and to fit the new structures to the existing conditions.

1 In addition to material requirements, all pipe used for welded applications shall have a maximum carbon equivalency (CE) of 0.4 using the following equation: CE = %C + Mn/6 + %Cu/40 + %Ni/20 + %Cr/10 - %Mo/50 - %V/10

GENERAL NOTES

Permanent steel deck forms may be used at the Contractor's option and shall be at no additional cost to the Department. Such use may result in changes to the dead load deflection of the girder. Any cost for adjustments due to a change in the dead load deflection will be borne by the Contractor. Payment for deck concrete and structural steel will not be increased due to use of permanent steel deck forms.

Permanent steel deck forms shall conform to Subsection 802.14(b). Detailed plans, including detailed calculations and manufacturer's technical brochure, shall be submitted to and approved by the Engineer before work of forming the bridge deck is started.

Welding of form supports to the tension flange of steel girders will be permitted only in areas where shear connectors are used. When welding is not allowed, the method of fastening Z or ∠ supports to the flange must be approved by the Engineer.

Form sheets shall be fastened to supporting members and to each other with galvanized metal screws sufficient in size and number to provide a secure attachment. Alternate methods of attachment must be approved by the Engineer.

When the pitch of form corrugations match the reinforcing spacing, transversely align form sheets across the bridge to maintain the correct orientation of continuous reinforcing bars in the corrugations.

Bar support rods, when used, shall be sized and spaced to adequately support the bottom reinforcing mat at the required position.

High chairs shall be sized to support the top mat of reinforcing at the proper position. High chairs shall be placed at locations shown on the detail drawings.

See Section C-C for slab thickness tolerance between adjacent girder flanges.

② Distance from top of slab to top of girder as measured at centerline girder and as shown on superstructure detail drawings. Slab joints shall be installed before the sidewalk or raised median is poured. After installation of the joint in the sidewalk or raised median and prior to pouring the parapet rail, the joint sealer shall be placed extending across the deck slab from gutterline to gutterline and across the top of the sidewalk or raised median to the edge of the slab. No joint sealer shall be placed on the deck slab under the sidewalk or raised median.

TRANSVERSE SLAB JOINT DETAIL

Use ½" x 1" Type 3 or 4 Joint Sealer. See Subsections 501.02(h) and 501.05(j). Backer Rod filler will not be required. Joint sealer shall be measured and paid for as Class SIAE) Concrete-Bridge. This joint shall be formed. Seal color shall be gray or other color similar to concrete.

Note: Each expansion joint device shall be blocked in the Shop by the Fabricator to the dimension "A" shown for 60° F and the blocking details shall be shown on the shop drawings. Blocking shall be placed within 2 feet of each end of the device and with a maximum spacing of 8 feet.

DETAILS FOR BLOCKING EXPANSION JOINT DEVICE

EXPANSION DEVICE INSTALLATION AT END BENTS:

The Contractor may elect to install the expansion device using one of the following two alternatives:

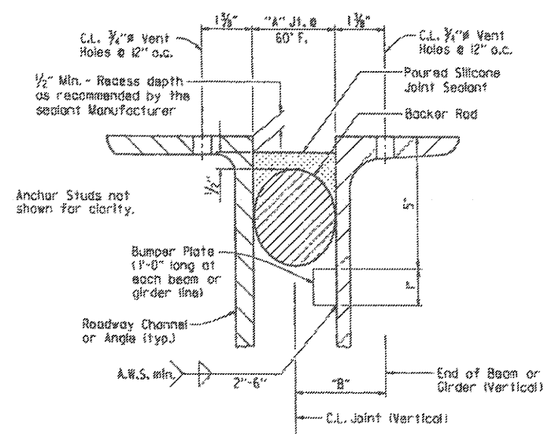
1) The concrete span pour adjacent to joint shall be placed before the end bent backwall is placed. After the end bent backwall forms are in place and the beams or girders erected, the blocked expansion device shall be installed and adjusted for grade. All connection bolts shall be fully tightened prior to placing the deck concrete adjacent to the bent, immediately prior to pouring the backwall concrete, the blocking shall be removed, and the opening adjusted for temperature and grade.

2) The backwall shall be poured to the optional construction joint after beams or girders are erected. The blocked expansion device shall be installed and adjusted for grade. All connection bolts shall be fully tightened prior to placing the deck concrete adjacent to the bent, immediately prior to pouring the remainder of the backwall concrete, the blocking shall be removed and the opening adjusted for temperature and grade.

EXPANSION DEVICE INSTALLATION AT INTERMEDIATE BENTS:

After all beams or girders on each side of the joint are erected the blocked expansion device shall be installed and adjusted for grade. Deck concrete shall be placed for the entire unit or span on one side of the joint before deck concrete on the other side is placed. Connection bolts for the first side to have deck concrete placed shall be completely bolted. Bolts on the other side shall be loosely installed so that thermal and rotational movements will not be restricted during concrete placement on the first side.

Connection bolts on the second side shall remain loose until the concrete pour adjacent to the joint is to be placed, immediately prior to pouring the span concrete on the second side, the blocking shall be removed, the joint adjusted for temperature and grade, and the connection bolts tightened.



DETAIL OF POURED SILICONE JOINT

Silicone joint material and installation shall conform to Section 809. The temperature limitations recommended by the sealant Manufacturer shall be observed. The sealant shall be installed only when the average 24 hour air temperature is between 40° and 80° F.

Use an appropriately sized backer rod at the depth shown in the Manufacturer's literature based on the joint width at the time of sealing. Unless otherwise noted, do not install more backer rod than can be sealed in the same day.

The Contractor shall verify separation of the backer rod from the joint material after the joint material has set.

When bridge deck is constructed in stages, backer rods shall be extended beyond length of poured joint in initial construction stage so that the two pieces can be properly spliced together prior to installing sealant in subsequent stages. Manufacturer's recommendations shall be followed to prevent sealant from "running out of joint" during stage construction.

GENERAL NOTES

1. CONCRETE PIPE CULVERT CONSTRUCTION SHALL CONFORM TO ARKANSAS STATE HIGHWAY AND TRANSPORTATION DEPARTMENT STANDARD SPECIFICATIONS FOR HIGHWAY CONSTRUCTION (CURRENT EDITION), WITH APPLICABLE SUPPLEMENTAL SPECIFICATIONS AND SPECIAL PROVISIONS. UNLESS OTHERWISE NOTED IN THE PLANS, SECTION AND SUBSECTION REFER TO THE STANDARD CONSTRUCTION SPECIFICATIONS.
2. CONCRETE PIPE CULVERT DESIGN SHALL CONFORM TO AASHTO LRFD BRIDGE DESIGN SPECIFICATIONS, FIFTH EDITION (2010) WITH 2010 INTERIMS.
3. ALL PIPE SHALL CONFORM TO SECTION 606. CIRCULAR R.C. PIPE CULVERTS SHALL CONFORM TO AASHTO M170, R.C. ARCH PIPE CULVERTS SHALL CONFORM TO AASHTO M206 AND HORIZONTAL ELLIPTICAL PIPE CULVERTS SHALL CONFORM TO AASHTO M207.
4. ALL PIPE SHALL BE PROTECTED DURING CONSTRUCTION BY A COVER SUFFICIENT TO PREVENT DAMAGE FROM PASSAGE OF EQUIPMENT.
5. THE MINIMUM TRENCH WIDTH SHALL BE THE OUTSIDE DIAMETER OF THE PIPE PLUS 24 INCHES. THE MAXIMUM ALLOWABLE TRENCH WIDTH SHALL BE THE MINIMUM WIDTH PRACTICABLE FOR WORKING CONDITIONS.
6. MULTIPLE PIPE CULVERTS SHALL BE INSTALLED WITH A MINIMUM CLEARANCE OF 24 INCHES BETWEEN STRINGS OF PIPE. REFER TO STD. DWG. FES-2 FOR MINIMUM CLEARANCE WHERE FLARED END SECTIONS ARE USED.
7. IMPERVIOUS MATERIAL SHOULD BE PLACED AS DIRECTED BY THE ENGINEER AT THE ENDS OF THE CULVERT TO PREVENT LOSS OF STRUCTURAL BEDDING WHEN PERVIOUS MATERIAL IS USED FOR STRUCTURAL BEDDING AND/OR BACKFILL.

THE HOLE SHALL NOT BE MORE THAN TWO INCHES IN DIAMETER OR TWO INCHES SQUARE. CUTTING OR DISPLACEMENT OF REINFORCEMENT WILL NOT BE PERMITTED. SPALLED AREAS AROUND THE HOLE SHALL BE REPAIRED IN A WORKMANLIKE MANNER. LIFTING HOLE SHALL BE FILLED WITH MORTAR, CONCRETE, OR OTHER METHOD AS APPROVED BY THE ENGINEER.
9. WHEN DIRECTED BY THE ENGINEER, UNSUITABLE MATERIAL THAT IS ENCOUNTERED AT THE BOTTOM OF THE EXCAVATED TRENCH (BELOW THE AREA IDENTIFIED AS "STRUCTURAL BEDDING" ABOVE) WILL BE EXCAVATED AND REPLACED WITH SELECTED PIPE BEDDING. THE QUANTITY OF MATERIAL REQUIRED TO BACKFILL THE UNDERCUT AREA UP TO THE SELECTED PIPE BEDDING PAY LIMIT DESIGNATED ABOVE WILL BE MEASURED AND PAID FOR AS "SELECTED PIPE BEDDING."

GENERAL NOTES:

1. ALL TRAFFIC CONTROL DEVICES USED ON ROAD CONSTRUCTION SHALL CONFORM TO THE MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES, LATEST EDITION, AND TO THE STANDARD HIGHWAY SIGNS, LATEST EDITION, OR AS APPROVED BY THE FEDERAL HIGHWAY ADMINISTRATION.
2. TRAFFIC CONTROL DEVICES SHALL BE SET UP JUST BEFORE THE START OF CONSTRUCTION OPERATIONS AND SHALL BE PROPERLY MAINTAINED DURING THE TIME SUCH CONDITIONS EXIST. THEY SHALL REMAIN IN PLACE ONLY AS LONG AS NEEDED AND REMOVED THEREAFTER.
3. EXISTING SIGNS AND CONSTRUCTION SIGNS SHALL BE KEPT IN PROPER POSITION, AND BE CLEAN AND LEGIBLE AT ALL TIMES. SIGNS THAT DO NOT APPLY TO EXISTING CONDITIONS SHALL BE REMOVED. SIGNS THAT ARE DAMAGED, DEFACED, OR THAT ACCUMULATE DIRT DURING CONSTRUCTION SHALL BE CLEANED, REPAIRED, OR REPLACED.
- 4. SIGNS ARE USUALLY MOUNTED ON A SINGLE POST, ALTHOUGH THOSE WIDER THAN 36" OR LARGER THAN 10 SQ. FT. SHALL BE MOUNTED ON TWO POSTS OR ABOVE A TYPE III BARRICADE.
- 5. SIGN POSTS DIRECT BURIED IN SOIL SHALL BE 2 LB. MINIMUM CHANNEL POST OR 4"x4" WOOD POSTS. CHANNEL POSTS SHALL BE PAINTED GREEN. WOOD POSTS SHALL BE PAINTED WHITE. ALL POSTS SHALL BE NEATLY CONSTRUCTED, AND SHALL BE REPLUMBED, CLEANED, OR REPAIRED AS NEEDED FOR THE DURATION OF THE JOB. THERE SHALL NOT BE MORE THAN 2 POSTS IN A 7' PATH FOR WOOD OR CHANNEL POSTS. ANY CHANNEL POST SPLICE SHALL BE IN ACCORDANCE WITH STANDARD DRAWING TC-3.
6. POST MOUNTED SIGNS IN RURAL AREAS SHALL BE CONSTRUCTED WITH THE NEAR EDGE OF THE SIGN FROM 6 TO 12 FEET FROM THE PAVEMENT EDGE. SIGNS IN URBAN AREAS AND BARRICADE MOUNTED SIGNS SHALL BE MOUNTED A MINIMUM OF 2 FEET FROM THE PAVEMENT EDGE.
7. ALL POST AND BARRICADE MOUNTED SIGNS MOUNTED IN URBAN AREAS SHALL BE MOUNTED A MINIMUM DISTANCE OF 7' FROM THE BOTTOM OF THE SIGN TO THE ROADWAY SURFACE. ALL POST AND BARRICADE MOUNTED SIGNS MOUNTED IN RURAL AREAS SHALL BE MOUNTED A MINIMUM DISTANCE OF 7' FROM THE BOTTOM OF THE SIGN TO THE ROADWAY SURFACE, EXCEPT A MINIMUM OF 6' SHALL BE USED WHEN MOUNTING AN ADVISORY SIGN BELOW A WARNING SIGN. TEMPORARY SIGNS MAY BE MOUNTED ON PORTABLE SUPPORTS FOR INTERMEDIATE TERM STATIONARY WORK CONDITIONS. THE SIGNS MINIMUM MOUNTING HEIGHT SHALL BE 5'. RETROREFLECTIVE DEVICES SHALL BE USED. TEMPORARY SIGNS MAY BE MOUNTED ON PORTABLE SUPPORTS FOR SHORT-TERM, SHORT DURATION, AND MOBILE CONDITIONS. THEY SHALL BE NO LESS THAN ONE (1) FOOT ABOVE THE TRAVELED WAY. LONG-TERM STATIONARY SIGNS SHALL BE DIRECT BURIED IN SOIL, UNLESS CONDITIONS NECESSITATE THE USE OF PORTABLE SIGNS, OR AS APPROVED BY THE ENGINEER. CONCRETE PADS, CONCRETE OR ROCK BALLAST, OR OTHER SOLID MATERIALS SHALL NOT BE UTILIZED WITH PORTABLE SIGN SUPPORTS.
8. FLAGGERS SHALL USE REFLECTORIZED STOP-SLOW PADDLES. FLAGS MAY BE USED ONLY FOR EMERGENCY SITUATIONS.
9. MOST OF THE SIGNS SHOWN ARE ORIENTED TO THE RIGHT. HOWEVER, THIS DOES NOT PRECLUDE THE USE OF MIRROR IMAGES OF THESE SIGNS WHERE THE REVERSE ORIENTATION MIGHT BETTER CONVEY TO MOTORISTS THE PROPER DIRECTION OF MOVEMENT.
10. R55-1 SIGNS SHALL BE PLACED AT LEAST 1500' BUT NOT MORE THAN 1 MILE IN ADVANCE OF THE WORK ZONE. IF A SPEED LIMIT REDUCTION IS IN EFFECT, THE SIGN SHALL BE PLACED A MINIMUM OF 500' IN ADVANCE OF THE "REDUCED SPEED AHEAD" SIGN.

- NOTE: SUPPORTS FOR SIGNS, BARRICADES, AND VERTICAL PANELS THAT ARE DIFFERENT FROM THE REQUIREMENTS SHOWN IN NOTES 4 & 5, BUT MEET THE REQUIREMENTS OF NCHRP-350 OR MANUAL FOR ASSESSING SAFETY HARDWARE (MASH), WILL BE ACCEPTED. COMPLIANCE WITH THE REQUIREMENTS OF NCHRP-350 OR MANUAL FOR ASSESSING SAFETY HARDWARE (MASH) IS REQUIRED FOR ALL PROJECTS.

GENERAL NOTES:

1. A speed limit reduction may be implemented ONLY when designated in the plan or when recommended by the Roadway Design Division.
2. When the existing speed limit is 55mph and the plans require a speed limit of 45mph, the R2-1(55) shall be omitted and the W3-5 shall be installed at that location. Additional R2-1 45mph speed limit signs shall be installed at a maximum of 1 mile intervals. At the end of the work area a R2-1(XX) shall be installed to match original speed limit.
3. When the existing speed limit is 65mph and the plans require a speed limit of 55mph, the R2-1(45) shall be omitted. Additional R2-1 55mph speed limit signs shall be installed at a maximum of 1 mile intervals. At the end of the work area a R2-1(XX) shall be installed to match original speed limit.
4. The maximum spacing between channelizing devices in a taper should be approximately equal in feet to the speed limit. Beyond the taper, maximum spacing shall be two times the speed limit or as directed by the Engineer.

Other Precast Concrete Barriers that have been crash tested and approved by the Federal Highway Administration to meet the requirements of NCHRP-350 test level 3 or Manual For Assessing Safety Hardware (MASH) will be accepted in lieu of the barrier shown. Drain slots shall be provided as needed or as directed by the Engineer. The Contractor shall furnish a certification of NCHRP Report 350 or Manual For Assessing Safety Hardware (MASH) compliance for any other types of precast barrier to be used. The certification shall state that the precast concrete barrier meets the requirements of NCHRP Report 350 or Manual For Assessing Safety Hardware (MASH) and include a copy of the Federal Highway Administration's (FHWA) approval letter with all attachments. Precast concrete barrier units shall be fabricated and installed in accordance with crash testing and documentation provided in the FHWA approval letter. Mixing of shapes will not be allowed in a continuous line of units.

RAMP SELECTION CRITERIA

FIRST CHOICE	TYPE 1	CORNER LOCATIONS WITH THE WALK ADJACENT TO THE CURB (BOTH NEW CONSTRUCTION AND ALTERATIONS).
	TYPE 2	CORNER LOCATIONS WITH THE WALK OFFSET FROM THE CURB A DISTANCE INSUFFICIENT TO ALLOW THE REQUIRED RAMP SLOPE (BOTH NEW CONSTRUCTION AND ALTERATIONS).
	TYPE 3	CORNER LOCATIONS WITH THE WALK OFFSET FROM THE CURB A DISTANCE SUFFICIENT TO ALLOW THE REQUIRED RAMP SLOPE (BOTH NEW CONSTRUCTION AND ALTERATIONS).
	TYPE 4	TANGENT LOCATIONS (BOTH NEW CONSTRUCTION AND ALTERATIONS).
SECOND CHOICE	TYPE 5	TANGENT LOCATIONS (ALTERATIONS ONLY).
THIRD CHOICE	TYPE 6	CORNER LOCATIONS (ALTERATIONS ONLY). THIS RAMP MAY BE USED ONLY IF THE TYPE 5 RAMPS CANNOT BE PLACED AT THE ENDS OF THE RADIUS.
FOURTH CHOICE		IF SITE CONSTRAINTS PREVENT THE CONSTRUCTION OF ANY OF THE TYPES LISTED, THEN AND ONLY THEN CAN THE 12:1 MAX. SLOPE ON THE RAMP BE EXCEEDED TO PROVIDE ACCESS TO THE STREET LEVEL (ALTERATIONS ONLY). THE SLOPE CAN BE STEEPENED TO A 10:1 MAX. FOR A MAX. LENGTH OF 5' OR A 8:1 MAX. FOR A MAX. LENGTH OF 2'. SLOPES STEEPER THAN 8:1 ARE NOT ALLOWED UNDER ANY CIRCUMSTANCES.

NOTE: IN ALTERATIONS, THE SELECTION OF THE TYPE OF WHEELCHAIR RAMP TO BE CONSTRUCTED SHALL BE BASED ON THE AMOUNT OF RIGHT-OF-WAY AVAILABLE, AND ON THE PRESENCE OF OTHER SITE CONSTRAINTS (UTILITIES, BUILDINGS, ETC.). THE TABLE ABOVE LISTS THE ORDER IN WHICH THE RAMPS ARE TO BE CONSIDERED.

AN ALTERATION IS DEFINED AS A PROJECT THAT CHANGES OR AFFECTS THE USE OF A PEDESTRIAN PATHWAY (OVERLAYS, SIGNALIZATION PROJECTS, ETC.) BUT DOES NOT REQUIRE THE PURCHASE OF ADDITIONAL RIGHT-OF-WAY. ALL PROJECTS THAT REQUIRE THE PURCHASE OF ADDITIONAL RIGHT-OF-WAY WILL USUALLY BE CONSIDERED NEW CONSTRUCTION FOR THE PURPOSES OF THE CHART ABOVE.
